

## Project report

### ‘Viaduct project’ Cumbria

## Project description

AquaRockBag® is not only used for high-volume project in big rivers or seas as can in the present project: In Cumbria (North England), AquaRockBag® was used to support a failing road that was getting severely undercut by an adjacent river.

AquaRockBag® was chosen over rock armour due to speed of installation and the fact that it **blends in more sensitively with the local environment** – they begin to vegetate one year after being installed.

immediate result

'Viaduct project' Cumbria

**One year later ...**
